COMPLETE SPECIFICATION

Shampoo Compositions

We, Colgate-Palmolive-Peet Company, a Corporation organised and existing under the Laws of the State of Delaware, United States of America of 105 Hudson Street, Jersey 5 City, New Jersey, United States of America, do hereby declare the invention, for which we pray that a patent may be granted to us, and the method by which it is to be performed, to be particularly described in and by the follow-

10 ing statement:—
This invention relates to shampoos.

According to the present invention a shampoo comprises a water-soluble organic synthetic detergent and a minor proportion in relation 15 to the proportion of detergent of a substantially colourless hair-substantive organic fluorescent dye in an aqueous medium.

The shampoos of the invention are characterized by a high lathering or foaming power, 20 excellent cleansing properties when applied to human hair in soft and hard water, and adsorption of the fluorescent dye upon the human hair with resultant elimination of dulling effects and added brilliance and lustre.

The synthetic detergent used in the present invention is preferably an anionic water-soluble organic sulphate or sulphonated detergent or a mixture of such detergents. The detergents preferably are aliphatic in structure.
Among the suitable aliphatic detergents are sulphuric acid esters of polyhydric alcohols incompletely esterified with higher fatty acids, e.g., "coconut" fatty acid monoglyceride monosulphate, and lauroyl monoglyceride and diphates, including both primary and secondary higher fatty alcohol sulphates, e.g., lauryl sulphate, and mixed higher fatty alcohol sulphates derived from reduced coconut oil fatty acids;
the higher fatty acids (e.g., coconut fatty acids) ethanolamide sulphates the higher fatty acids amides of amino lower alkyl sulphonic

acids, e.g., lauric acid amide of taurine; and dioctyl sulphosuccinate. The terms 45 higher fatty acid, and higher fatty alcohol are used herein to refer to acids or alcohols having an aliphatic chain of not less than eight carbon atoms, whilst the corresponding terms lower fatty acid and lower fatty

alcohol refer to compounds having a chain 50 with fewer carbon atoms. These aliphatic detergents preferably have an aliphatic chain within the range of 8 to 22 carbon atoms, whilst the carboxylic ester detergents preferably have an acyl radical of 8 to 18 carbon 55 atoms. The alkyl aryl sulphonate detergents may be employed, although these are less suitable because of their marked drying power. Alkyl aryl sulphonate detergents which may be used include those derived from 60 benzene, toluene, phenol and naphthalene, with the alkyl substituent selected for effective detersive power. Of the alkyl aryl sulphonates, it is preferred to use the higher alkyl benzene sulphonates wherein the alkyl group has 8 to 65 18, and preferably 10 to 16 carbon atoms, such as dodecyl benzene sulphonate or decyl benzene sulphonate.

These various anionic detergents are usually used in the form of their water-soluble salts. 70 The alkali metal salts, e.g., sodium, potassium or lithium, may be employed, though it is preferred to use the salts of nitrogen-containing bases, particularly in liquid shampoo solutions in view of the generally greater water-solubil- 75 ity of these salts. Suitable salts are the ammonium and lower alkylolamine salts, such as the ethanolamine salts including monodi-, and triethanolamine salts, and mixtures thereof.

With regard to the fluorescent dye, it may be mentioned that a development in the textile industry has been the incorporation into laundering compositions of certain fluorescent chemical compounds for the purpose of mak-85 ing laundered fabrics appear whiter. These so-called whitening agents or optical bleaches are fluorescent dyes which, when applied to cellulosic fibres, absorb ultraviolet light and emit visible light. By fluorescing blue to the ultra-90 violet rays in daylight, such dyes offset to some degree the yellowing tendencies developed in many white fabrics. Florescent dyes have also been suggested for other applications, such as for use in paper products, as sun-screening 95 agents in sun-tan lotions, and as identification markings.

The formulation of shampoos, however, is

[Price 3s. Od.]

a specialized field of endeavor and many special considerations have to be taken into account such as cleaning power, rinsability, and absorption effects on the hair, as well as the re-5 quisite physical and chemical properties of the products, e.g., adequate concentration of solids, and compatibility of the ingredients. Thus for the purpose of the present invention there are certain special criteria of suitability for the

10 fluorescent dye which should be observed. The fluorescent dyes suitable for use in the present invention should possess the following properties. First, the dyes should absorb the near ultra-violet rays such as from about three 15 thousand up to about four thousand Angstrom units and emit light in the visible range. Secondly, the emitted visible light should be substantially colourless (this does not exclude a blue or violet tinge in the emitted light, as 20 distinguished from a deep colour), which tends to accentuate the hue of the half and reduce dulling effects, particularly on blonde or grey hair. Furthermore, the fluorescent dye should not basically change the original or desired 25 colour of the shampoo, in the quantities in which it is normally employed. Another re-

quirement is that the dye should be sufficiently substantive or adsorbed upon human hair while in contact with the detergent and under the 30 conditions of use, since a dye that is substantially non-substantive to hair cannot give the desired effects. This requirement involves a number of considerations. It has been found that hair-substantive dyes are amenable to

35 selective adsorption by the hair from solutions containing the indicated sulphated or sulphonated detergents during the cleansing procedure and will not be readily washed off during the rinsing or other subsequent cleaning operations.

40 The anionic detergent per se is usually substantive to hair also, but the fluorescent dye is preferentially or selectively adsorbed during use of the shampoo. The term "adsorption" is used herein to denote that the dye is re-

45 tained upon the hair and there exhibits the fluorescent effect. The exact mechanism of the action, whether it be absorption, adsorption, electrostatic or hydrogen bonding, or some other effect, is not known at this time. An-

50 other requirement is that the fluorescent dye should be uniformly dispersed in the aqueous medium in order to facilitate proper application. The dye may be dissolved, emulsified or similarly incorporated in the shampoo, depend-55 ing upon the particular composition and type

of product. Further considerations include non-toxicity and non-irritability under conditions of use.

It has been found that suitable dyes having 60 superior hair-substantivity are the fluorescent coumarin compounds, particularly the hair-substantive 4-methyl coumarin compounds. Optimum effects have been obtained with the use of 4-methyl, 7-diethyl amino coumarin, 65 though other 4-methyl, 7-di lower alkyl amino

coumarin compounds such as 4-methyl, 7-dimethyl amino coumarin may be employed with satisfactory results. Another suitable compound is 5,7 dihydroxy 4-methyl coumarin.

These dyes exhibit more pronounced affinity 70 for the hair in the presense of the detergent when the shampoo is somewhat acid, such as having a pH from 4 up to 7, and usually in the range 4.5-6.5. Such effects are characteristic with these dyes, since other types of dyes may 75 exhibit their optimum effect in alkaline solution. This characteristic of the coumarin compounds can be fully exploited in shampoo containing sulphated or sulphonated detergents since these detergents exhibit effective cleaning and 80 foaming power under acid conditions. Furthermore, it is preferred to employ the aliphatic carboxylic ester detergents, such as fatty acid monoglyceride sulphates, in an acidic medium, since these detergents are more liable to hydro- 85 lysis or decomposition when alkaline. The acidity of the shampoo may be adjusted in any suitable manner, such as by the addition of mineral acids, e.g. sulphuric acid, to the detergent. Suitable organic acids such as citric 90 acid may be used also. Bases such as ammonium hydroxide may also be used as desired for correcting over-acidity.

The indicated coumarin dyes are waterinsoluble for practical purposes, but the deter- 95 gent aids in the apparent solubilization of these dyes in an aqueous medium, and it is thus possible to produce clear, homogeneous liquid shampoos containing these coumarin dyes. Such dyes usually are mildly cationic in nature, 100 but they do exist in apparent solution with the anionic detergent in the proportions employed

in shampoos.

With regard to the proportions of detergent and fluorescent dye in the shampoo in general 105 the concentration of the detergent should be at least 5%, e.g., within the range of 5—50%, and usually within the range 10—35%, though it is preferred to use from 15 to 30% detergent, by weight of the shampoo. Such deter- 110 gent concentrations will be sufficient to cleanse the hair effectively and ensure adequate foaming or lathering power. The foaming property is beneficial, since the foam or lather aids in dispersing or bringing the dye into thorough 115 contact with the hair, thereby effecting more uniform adsorption. These proportions are also in excess of the critical micelle concentration of the sulphated or sulphonated detergents, which increases the solubilization of the 120 fluorescent dyes in the aqueous medium. In clear liquid shampoos, the amount of detergent should, of course, be within its solubility limits in the solvent. The fluorescent dye is employed in minor proportion in relation to 125 the proportion of detergent and in a sufficient amount for preferential adsorption upon the hair, but does not exceed 1% by weight of the shampoo composition. It has been found that, generally at least 0.05% is required, but 130

it is preferred to use at least 0.1% of the dye by weight of the shampoo; excellent results are obtained with concentrations of at least 0.2%

The solubilization effect on the fluorescent dye exerted by the detergent can be enhanced by adding a water-soluble (including watermiscible) alcoholic solvent. The lower monohydric alcohol solvents such as ethyl alcohol 10 and isopropyl alcohol are particularly useful in the formulation of clear liquid shampoos, both for solubilizing the fluorescent dye and for stabilizing the shampoo under adverse conditions. Other alcohols such as 15 propylene glycol and methyl carbitol may be employed if desired. Such alcoholic solvents should, ordinarily, be used in minor amounts, such as from 1-30% and preferably 5-25% by weight of the shampoo. The aqueous (in-20 cluding aqueous alcoholic) medium preferably

forms the major proportion of the total composition, being at least 50%, and preferably from 65% up to 95% by weight of the shampoo.

In addition to clear liquid shampoos, the shampoo compositions of the present invention may be prepared in any desired physical form, including liquid creams, pastes, gels, and aerosol shampoos. Such products may be pre-

30 pared in the usual manner. The fluorescent dye is usually incorporated with the detergent in the aqueous base with stirring under slightly elevated temperatures, such as about 65 Any desired additional ingredients may be in-35 corporated in the conventional manner.

It is common to add various adjuvant materials to shampoo compositions. Such additional ingredients may be employed as desired, depending, of course, upon the desired charac-

40 ter of the final product. Thus, the shampoo ordinarily will contain perfume which should be selected so as to be compatible with the other ingredients. Suitable buffering materials may also be added as desired. Other ingredients

45 which may be used in shampoos for imparting desired qualities to the hair or the product are hair conditioners of superfatting materials such as lanolin, lecithin, fatty alcohols or fatty amides, in minor proportions. Minor amounts

50 of inorganic salts suh as ammonium sulphate, triethanolamine sulphate or sodium pyrophosphate may be present in the shampoos also. Glycerine may also be added, in amounts up to 10% usually. Colouring materials, such as

55 dyes or whitening agents for the shampoo may also be employed as desired. Preservatives such as sodium benzoate may be added to prevent mould growth. Thickening agents such as sodium carboxymethylcellulose may also be

The invenion may be performed in various ways, and the following specific examples are given by way of illustration. The percentages of the various ingredients are by

65 weight.

EXAMPLE I The following composition was a clear homo-

meous iiquid sna	mħ			• •	. % .	
*Detergent salt	_	- .	<u> </u>	. <u>.</u>	21.0	70

Perfume -	_	-	_	-	0.4	
Water -	_	-	-	-	Q.S.	75
Ammonium salt	of	sulpl	hated	mo	noglycerid	е

It contained about 10% by weight of inorganic sulphate salt formed in its manu-

facture. This composition had a pri adjusted to about 6.2. Upon use on the hair, this shampoo exhibited a high level of lathering and cleansing power with marked adsorption of the fluorescent material upon the hair. The hair 85 after washing had a greater lustre and sheen than was obtained with shampoos which did not contain such fluorescent dye.

Example II Another satisfactory clear liquid shampoo 90 had the following composition:-

an mo tomoning competition		%	
*Detergent salt -		25.0	
4-methyl 7-diethyl	amino		
coumarin		0.2	95

What we claim is:-1. A shampoo comprising a water-soluble organic synthetic detergent and a minor proportion in relation to the proportion of detergent of a substantially colourless hair-substan- 120 tive organic fluorescent dye, in an aqueous medium.

2. A shampoo as claimed in Claim 1 in which the fluorescent dye is a coumarin compound. 3. A shampoo as claimed in Claim 1 in which 125 the fluorescent dye is a 4-methyl 7-di lower alkyl amino coumarin.

4. A shampoo as claimed in Claim 1 in which the fluorescent dye is 4-methyl 7-diethylamino 5 coumarin.

5. A shampoo as claimed in any of the preceding claims in which the fluorescent dye is present in sufficient amount for preferential adsorption upon hair but does not exceed 1% 10 by weight of the shampoo.

 A shampoo as claimed in any of the preceding claims in which the detergent is an anionic sulphated or sulphonated detergent.

A shampoo as claimed in any of Claims 1
 to 5 in which the detergent is a higher fatty acid monoglyceride sulphate.

8. A shampoo as claimed in any of Claims 1 to 5 in which the detergent is a higher alkyl sulphate.

20 9. A shampoo as claimed in any of the pre-

form of a salt of a nitrogen containing base.

10. A shampoo as claimed in any of Claims
1 to 8 in which the detergent is in the form
of an ammonium salt

of an ammonium salt.

11. A shampoo as claimed in any of the preceding claims in which the amount of the de-

ceding claims in which the amount of the detergent present is between 10% and 35% by weight of the shampoo.

12. A shampoo as claimed in any of the pre- 30 ceding claims in which the aqueous medium is an alcoholic aqueous medium.

13. A shampoo as claimed in any of the pre-

ceding claims which is acidic.

14. A shampoo as claimed in any of Claims 1 35

to 12 of which the pH value is between 4.5 and 6.5.

15. A shampoo having a composition substantially in accordance with any of the fore- 40 going examples.
